Organ

The organ is an instrument that can be divided into two main types: the pipe organ and the digital organ. Traditionally, the organ is made up of pipes and can have multiple keyboards and rows of pipes. These pipes can vary in size and shape, producing a wide range of tones.

Here are some features of the organ:

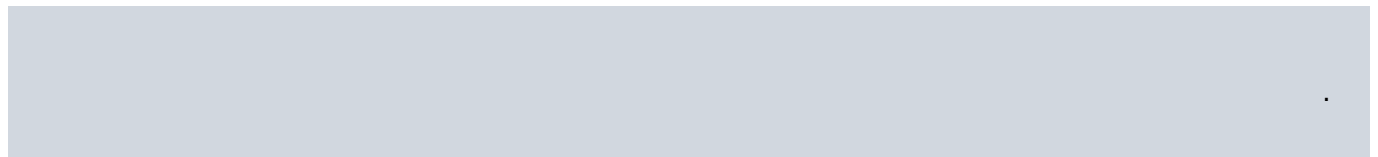

1. **Varied Tones:** Organs can produce a wide variety of tones using different types and sizes of pipes. These pipes, with varying lengths and diameters, create diverse sounds.
2. **Multiple Keyboards:** Most organs have two or more keyboards. In addition to the main keyboard,

known as the manual, there may be additional keyboards for playing different types of pipes, such as the solo and choir manuals.

3. Pedalboard: The pedalboard is used to play the lower notes of the organ. Like the keyboards, it consists of pedals of various lengths to produce different tones.

4. Complexity and Versatility: Organs are capable of producing a wide range of musical effects and tones. However, due to their complexity and size, playing the organ requires specialized skills and expertise.
