Stereophonic

Stereo is an audio format that differs from mono in that it uses the left and right channels. By the orientation of the left and right speakers, a virtual phantom image is created, which is referred to as a stereo image. Through this stereo image, sounds can be spatially arranged within the stereo image space, creating a sense of directionality in the sound. By utilizing two independent channels, we can generate sounds coming from various directions, much like how humans hear with two ears. In fact, it's possible to achieve most of the spatial soundstage using just stereo, without the need for quadraphonic or surround sound.
