## Earphones & Headphones

**Earphones** are portable audio devices with small speakers or drivers attached to the ear, designed to be inserted into the ears for listening to music or audio. Earphones, because they go directly into the ears, may require special technology to block or cancel out ambient noise. They are convenient for use on the go or during physical activities, making them a popular choice for portable audio devices.

**Headphones**, on the other hand, are audio devices designed to cover the ears, with large speakers or drivers attached to each earcup. Headphones provide relatively effective noise isolation due to their ear-covering design, allowing for more immersive listening experiences when enjoying music or audio. Headphones are used for various purposes, including music listening, audio editing, gaming, and phone calls. There are two main types of headphones: Over-ear headphones completely cover the ears, while on-ear headphones rest on the ears.
