Boundary Microphone

A Boundary Microphone is a type of microphone that captures audio through close proximity to a flat surface. This microphone is typically placed or mounted on a flat surface, commonly a table, podium, floor, or wall. Boundary microphones excel at capturing ambient sound and are commonly used in various applications such as meetings, lectures, stage performances, recording studios, and more.

Due to their close proximity to the flat surface, boundary microphones minimize **surrounding noise** and record audio or voice signals with **clarity**. One of the key features of boundary microphones is their 360-degree omnidirectional pickup pattern, allowing them to capture sound from all directions. This makes them particularly suitable for recording multiple participants' voices or for use in conference rooms.

Boundary microphones are commonly used in meeting rooms, conference halls, auditoriums, classrooms, stages, and for podcasting purposes. They are available in both fixed and portable models. These microphones can be discreetly installed in a space, providing both stylish aesthetics and high-quality sound capture.
