(Limiter)

(Dynamic Range)

()
가

limiter

A **limiter** is a type of signal processing device or software plugin used in audio processing and sound engineering. Its primary purpose is to control the maximum output **level** of an audio signal and prevent clipping (unexpected distortion). Limiters restrict the dynamic range and ensure that the audio signal does not exceed a specific threshold. This is used in music mixing, mastering, live sound reinforcement, and plays a crucial role in enhancing music and sound quality.
