# Tweeter

A unit in a speaker responsible for reproducing the high-frequency range.

The speaker below is [Yamaha](#)'s HS7 model, and the small black unit at the top is the tweeter.

In the case of tweeters, they handle frequencies that are extremely high, and as frequencies increase, the directional characteristics become very narrow. Consequently, most speaker manufacturers either create special types of tweeters (such as horn tweeters, dome tweeters, ribbon tweeters) or use special tweeter units (silk, diamond, ceramic, beryllium). They also focus on improving the form of baffles, enclosures, and waveguides (egg-shaped speaker design, B&W's tweeters) to widen the tweeter's directional characteristics. The improved directional characteristics of these tweeters contribute significantly to enhancing stereo imaging and providing a greater sense of realism in the stereo image (L and R speakers).
