Various replacement [terms](#) for 'master' or 'slave' have been proposed and implemented. In 2020, GitHub replaced the default 'master' git branch with 'main', although this action was controversial because of the term's etymology—for example, a master copy of an audio recording. Other replacement names include 'default', 'primary', 'controller', 'root', 'initiator', 'leader', 'director'; and for 'slave': 'performer', 'worker', 'peripheral', 'responder', 'device', 'replica', and 'secondary'. Python switched to 'main', 'parent', and 'server'; and 'worker', 'child', and 'helper', depending on context. The Linux kernel has adopted a similar policy to use more specific [terms](#) in new code or documentation. Many projects and standards have already used alternative [terms](#) since their inception.
